1. Ideation Phase

Auto Ticket Classification using Flow Designer

1. Ideation Phase

The project idea was developed from the requirement to improve the ticket-handling process in a school IT helpdesk. The helpdesk receives multiple support requests from students and teachers, including Wi-Fi issues, projector failures, password problems, and slow computers.

The existing process requires IT staff to manually review each request, identify the issue type, select the correct category and subcategory, and inform the caller about ticket creation. This process is time-consuming, error-prone, and difficult to scale.

The proposed solution is to automate ticket classification using ServiceNow Flow Designer. The system analyzes keywords in the Short Description and automatically assigns the appropriate Category and Subcategory.

Project Idea

- Automatically classify incidents at the time of creation.
- Reduce manual effort for IT agents.
- Improve ticket routing efficiency.
- Implement a no-code and easily maintainable solution.
- Send an automated email notification to the caller upon ticket creation.
